Browser save JWT token in LocalStorage.

## Client

## Server

1. With JWT, we don't need cookies.
2. JWT is stored in browser's localStorage, which user should not be able to change.
3. When sending requests, JWT is send with the request.
4. Any protected routes, such as requiring users to login first before posting new data, should be protected by JWT passport authentication middleware to check the validation of the request.
